Assignment 1016 Feedback

Chase Blokker

3a — Your code shows a decent understanding of how user interfaces are structured, with some technology-specific glitches here and there (see *4a*). (+)

3c — Your use of inline `style` attributes breaks MVC; at the time you coded this, I think it had been mentioned but not totally emphasized. Hope its importance is clearer now. (|)

4a — Most of your code does not validate, showing a range of errors. Some are not your fault, but are all fixable if you look them up or ask me. Some are more on you, like some unclosed tags and incorrect syntax (e.g., `class` attributes not followed by an equals sign). The first alarm pages also has absolute file references, which break on any other computer but yours (including the upload to *my.cs.lmu.edu*). Finally, your custom CSS shows a good amount of repetition; these should be collapsed into classes or other unified CSS blocks, in order to avoid repetitive edits if you decide to adjust styles. (/)

4b — You have separate CSS files, but still retain some inline `style` attributes. All CSS should go to your separate files. (|)

4c — Your code is generally understandable, consistently spaced. No comments were seen but it is true that they are not too critical here. Your indent standard of 2 spaces is tighter than I would prefer, but you do apply this consistently so at least you are clear that this is an explicit choice. (+)

4d — You got a lot of things working on your own, which is fine here. There are some additional things to learn, but for this assignment you did enough. (+)

4e — Excellent commit pacing and messages. (+)

4f — Submitted on time. (+)
